NORTHERN INDIANA POPULATION CHANGES, 1970-1980

This report is designed to show the population changes occurring between 1970 and 1980 in Northern Indiana, its subareas, and its counties. The Region and its subareas are defined in terms of Health Service Areas.

There are three basic tables for each area in addition to series of seven comparison tables.

The Basic Tables

1. Population, 1970 and 1980, by Age, Race, and Sex
2. Estimated Deaths, 1970 to 1980, by Age, Race, and Sex
3. Estimated Net Migration, 1970 to 1980, by Age, Race, and Sex

Comparisons are made between Northern Indiana and its subareas, and between each subarea and its counties. The Appendix gives comparisons between Indiana and its three Regions (Northern, Central, and Southern).

The Comparison Tables

A. Percent Population, 1970 and 1980, by Race and Sex

B. Percent Increase, 1970 to 1980, by Race and Sex (Broken Down by Migration and Natural Increase*)

C. Percent Population, 1970 tc 1980, by Age

D. Cumulative Percent Population, 1970 to 1980, Below and Above Certain Ages

E. Population Increase by Age Group, 1970 to 1980

F. Median Age, 1970 and 1980, by Race and Sex

G. Dependency Ratios**, 1970 and 1980

*Births minus Deaths

**(Population under 18 plus population over 65) divided by population 18-64

In the basic population tables, both 1970 and 1980 population figures are given. To allow for aging over the 10-year period, the 0-4 group in 1970 is put on the same line as the 10-14 group in 1980. Thus, the 1970 and 1980 populations that appear side-by-side represent the same group of persons. The same format is used in the death and migration tables.

Essentially, the net migration estimates in these reports are developed by taking the 1980 population in a given age group, adding the deaths occurring among members of this group between 1970 and 1980, and subtracting the 1970 population for the corresponding age group. (For example, the group corresponding to the 1980 20-24 group would be the 10-14 group in 1970.) For groups under 10 years of age in 1980, corresponding birth figures were used (since these groups were born subsequent to the 1970 Census).

Generally speaking, positive migration estimates are likely to be high and negative ones, low. This is because enumeration in the 1980 Census is considered to be more complete than in 1970.

Breakdowns by race are not given for counties with less than 1,000 nonwhite population.

Several factors should be considered in interpreting these figures: (1) Birth and death figures are not completely accurate, especially deaths broken down by age, race, and sex; (2) Census counts are not necessarily complete, and the degree of completeness may vary from group-to-group; (3) Military personnel are assigned by the Census to the post at which they are located, not their original home; (4) College students (if they reside on campus) are assigned to the college community; (5) Residence listings on birth and death certificates are not necessarily completely accurate; and (6) An undetermined number of persons listed as white in 1970 were enumerated as nonwhite in the 1980 Census.

Population figures for 1970 and 1980 are from the U.S. Census Bureau.

Similar reports will be prepared later for Central Indiana and Southern Indiana. Copies of this report and information on the others may be obtained from:

NORTHERN INDIANA

Net Migration Patterns

Between 1970 and 1980, Northern Indiana had a net migration loss of almost 73,000 people, with a virtually even split between males and females. The nonwhite population showed a migration gain of over 31,000, contrasted with the net white loss of 104,000.

By age, those below 5, 30-34, and over 85 in 1980 showed net migration gains, while all others experienced loss. In the white population, only males 30-34 in 1980 and both sexes over 85 had a positive in-movement; while for nonwhites, almost all groups gained.

Net out-migration cut Northern Indiana's intercensal rate of gain almost in half. Had there been no migration, the Region would have had an 8.7 percent increase instead of the actual figure of 4.8 percent.

Other pertinent data on migration for the Region and its subareas are given in Tables 1, 2, 3, and B.

Population by Race and Sex

Over the 10-year period, Northern Indiana's nonwhite population (heavily concentrated in the Gary-Hammond-East Chicago Subarea) increased from 9.1 to 11.8 percent of the total. In the decade, the male proportion decreased from 49.0 to 48.7 percent.

The white population had a higher median age than the nonwhite, and women had a higher "average" age than men.

Additional information on population by race and sex may be found in Tables 1, 2, 3, A, B, and F.

Population by Age

Over one third of Northern Indiana's population in 1980 was between 10 and 30, a carry over from 10 years before when 40 percent was under 40. In general, the population was older than it had been a decade earlier.

Five age groups (three under 15 and two between 40 and 50) had a decrease in population between 1970 and 1980. Because of the effects of the postWar baby boom, heaviest gain occurred i[illegible]ups 20 to 35, though all groups over 60 also had marked increases.

More figures on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA I-1 (GARY-HAMMOND-EAST CHICAGO)

Net Migration Patterns

In the intercensal period between 1970 and 1980, Subarea I-1 lost over 46,000 persons net through out-migration, thus accounting for well over 60 percent of Northern Indiana's net out-movement. The loss was evenly split by sex, but the nonwhite group showed substantial net in-migration, in marked contrast to the heavy losses experienced by whites.

By age, only that group which was 30-34 in 1980 showed any appreciable migration gains. While almost all nonwhite groups had positive migration, the male group between 30 and 35 was the only white one to have net in-migration.

Migration was an effective inhibitor of growth in the Subarea. Had there been no migration, the Sector would have had a 9.8 percent growth instead of the actual 2.8 percent figure.

Other information on migration for the Subarea and its counties is given in Tables 1, 2, 3, and B.

Population by Race and Sex

From 1970 to 1980, the Gary-Hammond-East Chicago Area increased its nonwhite population from 17.3 to 22.2 percent of the total. Over the same period, the male proportion decreased from 49.2 to 48.8 percent.

As was true for the whole Region, Subarea I-1's female population had an older "average" age than the male, and the white median age was above the nonwhite.

More data on race and sex may be found in Tables 1, 2, 3, A, B, and F.

Population by Age

In 1970, over 40 percent of the Subarea population was under 20. A decade later, this same group, now 10 to 30, constituted over one third of the total population.

There was a smaller population under 15 and between 40 and 55 in 1980 than 10 years before. Groups showing the biggest increase were those 20 to 35 and those over 60.

Additional figures on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA I-2 (SOUTH BEND)

Net Migration Patterns

The South Bend Subarea lost over 23,000 people net through out-migration between 1970 and 1980. The loss was essentially evenly split by sex; but where the nonwhite population actually had migration gains, the white experienced heavy loss.

Only the groups that were under 5 and between 30 and 34 in 1980 escaped net loss. White males 30-34 and white females 75-79 and 85+ showed some net gain through migration.

Had there been no net migration, the Subarea would have had twice as much gain over the decade as it did have. The actual percentage gain was 3.4 percent but would have been 7.1 percent based on births and deaths alone.

Other information on migration for the Subarea and its counties may be found in Tables 1, 2, 3, and B.

Population by Race and Sex

The nonwhite proportion of Subarea I-2's population increased from 5.3 to 7.0 percent over the decade. In the same period, the male proportion dropped from 49.0 to 48.7 percent.

The female population had a much higher median age than the male, and the white population, on the average, was considerably older than the nonwhite.

Figures on population by race and sex appear in Tables 1, 2, 3, A, B, and F.

Population by Age

The South Bend Subarea population was heavily concentrated in the 10 to 30 age span in 1980, an expected follow-up to the large proportion under 20 in 1970.

In general, the 1980 population was older than that of a decade earlier. Population under 20 and between 40 and 50 declined, while all other groups increased. Largest gains were in the young adult group (20-35) and those over 65.

Data on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA I-3 (FORT WAYNE)

Net Migration Patterns

Migration was not a major factor in overall population changes between 1970 and 1980 for the Fort Wayne Subarea. There was a total loss through out-movement of some 2,800 people. There was little difference between sexes in the pattern, but nonwhites had a positive pattern, while whites had net out-migration.

The group that was 10-14 in 1970 had major migration losses, mostly in the white male group. Those 10 years older had almost the opposite pattern with heavy total and white male gains. Other groups with moderate to heavy net in-migration were those under 5 and over 85 in 1980. Most other groups had moderate to light out-movement.

Migration patterns had a slightly negative effect in population growth over the decade for Subarea I-3. Had there been no net movement of population, the Area would have had a 9.2 percent growth instead of the 8.7 it actually experienced.

Information on migration for the Subarea and its counties is given in Tables 1, 2, 3, and B.

Population by Race and Sex

The nonwhite share of the Area population increased from 3.7 to 5.6 percent in the 10-year period. The male share remained constant at 48.7 percent.

As was generally true for Northern Indiana, the white population had a higher median age than the nonwhite, and females were, on the average, older than males.

Additional data on population by race and sex are available in Tables 1, 2, 3, A, B, and F.

Population by Age

In both 1970 and 1980, Subarea I-3 population was concentrated in the younger age groups. In the earlier year, it was in the under 20 segment; while 10 years later, it was in the 10 to 30 group.

In keeping with the pattern of an older population, there were fewer persons under 15 in 1980 than 1970, and also between 40 and 50. Big gainers were those between 20 and 40 as well as those over 55.

Tables 1, 2, 3, C, D, E, F, and G deal with population by age.

Indianapolis, Indiana 46206
-1984-

CENTRAL INDIANA POPULATION CHANGES, 1970-1980

This report is designed to show the population changes occurring between 1970 and 1980 in Central Indiana, its subareas, and its counties. The Region and its subareas are defined in terms of Health Service Areas.

There are three basic tables for each area in addition to series of seven comparison tables.

The Basic Tables

1. Population, 1970 and 1980, by Age, Race, and Sex
2. Estimated Deaths, 1970 to 1980, by Age, Race, and Sex
3. Estimated Net Migration, 1970 to 1980, by Age, Race, and Sex

Comparisons are made between Central Indiana and its subareas, and between each subarea and its counties. The Appendix gives comparisons between Indiana and its three Regions (Northern, Central, and Southern).

The Comparison Tables

A. Percent Population, 1970 and 1980, by Race and Sex

B. Percent Increase, 1970 to 1980, by Race and Sex (Broken Down by Migration and Natural Increase*)

C. Percent Population, 1970 to 1980, by Age

D. Cumulative Percent Population, 1970 to 1980, Below and Above Certain Ages

E. Population Increase by Age Group, 1970 to 1980

F. Median Age, 1970 and 1980, by Race and Sex

G. Dependency Ratios**, 1970 and 1980

*Births minus Deaths

**(Population under 18 plus population over 65) divided by population 18-64

In the basic population tables, both 1970 and 1980 population figures are given. To allow for aging over the 10-year period, the 0-4 group in 1970 is put on the same line as the 10-14 group in 1980. Thus, the 1970 and 1980 populations that appear side-by-side represent the same group of persons. The same format is used in the death and migration tables.

Essentially, the net migration estimates in these reports are developed by taking the 1980 population in a given age group, adding the deaths occurring among members of this group between 1970 and 1980, and subtracting the 1970 population for the corresponding age group. (For example, the group corresponding to the 1980 20-24 group would be the 10-14 group in 1970.) For groups under 10 years of age in 1980, corresponding birth figures were used (since these groups were born subsequent to the 1970 Census).

Generally speaking, positive migration estimates are likely to be high and negative ones, low. This is because enumeration in the 1980 Census is considered to be more complete than in 1970.

Breakdowns by race are not given for counties with less than 1,000 nonwhite population.

Several factors should be considered in interpreting these figures: (1) Birth and death figures are not completely accurate, especially deaths broken down by age, race, and sex; (2) Census counts are not necessarily complete, and the degree of completeness may vary from group-to-group; (3) Military personnel are assigned by the Census to the post at which they are located, not their original home; (4) College students (if they reside on campus) are assigned to the college community; (5) Residence listings on birth and death certificates are not necessarily completely accurate; and (6) An undetermined number of persons listed as white in 1970 were enumerated as nonwhite in the 1980 Census.

Population figures for 1970 and 1980 are from the U.S. Census Bureau.

A similar report has been prepared for Northern Indiana; and later, there will be one for Southern Indiana. Copies of this report and information on the others may be obtained from:

APPENDIX... 151

CENTRAL INDIANA

Net Migration Patterns

Central Indiana had a net loss of over 78,000 persons through out-migration between 1970 and 1980. The loss among males was considerably greater than for females. The nonwhite population proved an exception to the trend, with a net gain of over 13,000 from migration.

All age groups except those who were 75-79 and over 85 in 1980 shared in the loss. Several age groups had net losses of over 5,000, led by the 25-29 group with over 12,000. Others showing over 5,000 net loss were those who were 5-9, 10-14, 20-24, 35-39, 40-44, and 60-64 in 1980. Most nonwhite age groups showed net migration gains.

Net out-migration cut Central Indiana's potential gain almost in half. The actual increase for the decade was 3.84 percent instead of the 7.60 figure that would have occurred with no migration.

Other pertinent data on migration for the Region and its subareas may be found in Tables 1, 2, 3, and B.

Population by Race and Sex

For the intercensal period, Central Indiana's nonwhite population increased from 8.3 to 9.8 percent of the total. The female population went from 51.4 to 51.6 percent over the period.

As was generally true in Indiana, the white population had a higher median age than the nonwhite, and the female averaged older than the male.

Additional information on population by race and sex is given in Tables 1, 2, 3, A, B, and F.

Population by Age

Central Indiana's largest age group in 1980 was 15-19, with 9.7 percent of the total population. Those between 10 and 30 accounted for 36 percent of the Region total. In general, the population was older in 1980 than 1970, with a 2.4 year increase in median age.

Those under 15 and between 40 and 50 had smaller populations in 1980 than 1970, with other groups showing gains. Only those between 20 and 35 and over 85 had as much as a 20 percent increase.

Because of the decline in persons under 18, the dependency ratio dropped from .80 to .65 between 1970 and 1980.

More figures on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA II-1 (INDIANAPOLIS)

Net Migration Patterns

In the intercensal period between 1970 and 1980, the Indianapolis Subarea lost almost 35,000 persons net through out-migration. Loss was somewhat heavier among males than females. The nonwhite population proved an exception to the trend, with over 8,000 net gain.

Only those groups between 25 and 35 in 1980 showed marked gains through migration, while the 15 to 25 groups suffered the heaviest losses.

Had there been no migration, the Subarea would have experienced an 8.24 percent gain, but the out-migration reduced this figure to 5.11.

Further data on migration for the Indianapolis Subarea are found in Tables 1, 2, 3, and B.

Population by Race and Sex

Over the decade, the nonwhite proportion increased from 12.6 to 14.4 percent. The male proportion showed a small decline, as it dropped from 48.3 to 48.2 percent.

As was true for all areas in the State, the female median age was well above the male, and the white population averaged older than the nonwhite.

More information on population by race and sex is given in Tables 1, 2, 3, A, B, and F.

Population by Age

In 1980, the 15-19 group was the most populous, accounting for 9.4 percent of the total. The 10 to 30 groups accounted for 36 percent.

Groups under 15 and between 40 and 50 had smaller populations in 1980 than 1970. While all other ages showed an increase, major gains (over 20 percent) occurred among those 20 to 35 and over 80.

Additional figures on population by age are shown in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA II-2 (ANDERSON, MUNCIE, RICHMOND)

Net Migration Patterns

Subarea II-2 lost almost 33,000 persons net through out-migration between 1970 and 1980. Male losses were slightly higher than female. The nonwhite group was an exception to the rule, as it experienced a small gain through migration.

Only that group which was under 5 in 1980 showed a migration net gain. Heaviest losses were in those groups between 20 and 40 in 1980.

The negative migration almost balanced the natural increase (births minus deaths), leaving only a .49 percent gain for the Subarea over the decade.

Additional information on migration may be found in Tables 1, 2, 3, and B.

Population by Race and Sex

The Anderson, Muncie, Richmond Subarea increased its nonwhite population as a percent of the total from 4.0 to 4.7 percent between 1970 and 1980. Over the same period, the female share increased from 51.3 to 51.7 percent.

As was generally true for Indiana and its Regions, the female population had a higher median age than the male, and the white population had a higher average age than the nonwhite.

More data on race and sex are given in Tables 1, 2, 3, A, B, and F.

Population by Age

In 1980, the 15-19 age group was the largest one in population, with 9.9 percent of the total. Thirty-five percent of the population was in the 10 to 30 age range.

The under 15 and 40 to 50 population for the Subarea was smaller in 1980 than 1970. Other groups were larger in the latter year, but only those 30-34 and over 85 showed as much as a 20 percent increase.

Further material on population by age is given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA II-3 (KOKOMO, MARION)

Net Migration Patterns

Between 1970 and 1980, Subarea II-3 lost over 14,000 persons net through out-migration. Loss was slightly heavier among males than females, and the nonwhite population bucked the trend with a small net in-movement.

Each age group except for those over 75 in 1980 experienced net migration loss over the 10 years, with heaviest out-movement occurring among those 15 to 30 in 1980.

Out-migration effectively neutralized natural increase (births minus deaths) over the decade; and as a result, the Kokomo-Marion Subarea had a gain of less than 1,000 for the intercensal period.

Other data on migration are found in Tables 1, 2, 3, and B.

Population by Race and Sex

Over the 10-year period, the nonwhite proportion increased from 4.7 to 6.3 percent of the total. At the same time, the female proportion increased from 51.2 to 51.7 percent.

In line with other areas, the female population had a higher median age than the male, and the white population had a higher average age than the nonwhite.

Further information on race and sex may be located in Tables 1, 2, 3, A, B, and F.

Population by Age

The Area's largest population group in 1980 was the 15-19 year one, comprising 9.7 percent of the total population, while over a third fell in the 10-30 ages.

Most age groups had greater populations in 1980 than 1970, with the under 15 and 40 to 50 groups proving exceptions. Only those 30-34 and over 85 in 1980 had gains of over 20 percent.

Additional figures on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA II-4 (LAFAYETTE)

Net Migration Patterns

Between 1970 and 1980, the Lafayette Subarea had a net gain of some 3,400 persons through migration. Males and females shared the increase equally, but the nonwhite population had a disproportionate part of the total.

Because of the influence of Purdue University, persons in the 15-24 age group in 1980 showed the largest net migration (over 17,000), while those 10 years older showed the heaviest migration losses (over 11,000). In general, when students were excluded, those under 50 tended to have slight net outmovement, while older groups tended to show gains.

All-in-all, net migration contributed 1.37 percent to growth, thus accounting for approximately one sixth of the Subarea rate of increase.

Further information on migration is given in Tables 1, 2, 3, and B.

Population by Race and Sex

In 1970, just one percent of the Subarea population was nonwhite; but 10 years later, this proportion had increased to 2.1. Over the same period, the female percent increased from 50.4 to 50.5.

The median age of the female population was well above that of the male, and the white group averaged much higher in age than the nonwhite.

Additional material on population by race and sex may be found in Tables 1, 2, 3, A, B, and F.

Population by Age

The 20-24 age group, with 13.0 percent of the population, was the largest in 1980. Almost 40 percent of the total was between 10 and 30.

Most age groups had greater populations in 1980 than a decade earlier, with those 20 through 35 and over 85 each showing over a 30 percent increase. Exceptions to the general rule occurred for the groups under 15, affected by the end of the post-War baby boom, and those between 40 and 50 (born during the Depression years).

More data on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SOUTHERN INDIANA POPULATION CHANGES, 1970-1980

This report is designed to show the population changes occurring between 1970 and 1980 in Southern Indiana, its subareas, and its counties. The Region and its subareas are defined in terms of Health Service Areas.

There are three basic tables for each area in addition to series of seven comparison tables.

The Basic Tables

1. Population, 1970 and 1980, by Age, Race, and Sex
2. Estimated Deaths, 1970 to 1980, by Age, Race, and Sex
3. Estimated Net Migration, 1970 to 1980, by Age, Race, and Sex

Comparisons are made between Southern Indiana and its subareas, and between each subarea and its counties. The Appendix gives comparisons between Indiana and its three Regions (Northern, Central, and Southern).

The Comparison Tables

A. Percent Population, 1970 and 1980, by Race and Sex

B. Percent Increase, 1970 to 1980, by Race and Sex (Broken Down by Migration and Natural Increase*)

C. Percent Population, 1970 to 1980, by Age

D. Cumulative Percent Population, 1970 to 1980, Below and Above Certain Ages

E. Population Increase by Age Group, 1970 to 1980

F. Median Age, 1970 and 1980, by Race and Sex

G. Dependency Ratios**, 1970 and 1980

*Births minus Deaths

**(Population under 18 plus population over 65) divided by population 18-64

In the basic population tables, both 1970 and 1980 population figures are given. To allow for aging over the 10-year period, the 0-4 group in 1970 is put on the same line as the 10-14 group in 1980. Thus, the 1970 and 1980 populations that appear side-by-side represent the same group of persons. The same format is used in the death and migration tables.

Essentially, the net migration estimates in these reports are developed by taking the 1980 population in a given age group, adding the deaths occurring among members of this group between 1970 and 1980, and subtracting the 1970 population for the corresponding age group. (For example, the group corresponding to the 1980 20-24 group would be the 10-14 group in 1970.) For groups under 10 years of age in 1980, corresponding birth figures were used (since these groups were born subsequent to the 1970 Census).

Generally speaking, positive migration estimates are likely to be high and negative ones, low. This is because enumeration in the 1980 Census is considered to be more complete than in 1970.

Breakdowns by race are not given for counties with less than 1,000 nonwhite population.

Several factors should be considered in interpreting these figures: (1) Birth and death figures are not completely accurate, especially deaths broken down by age, race, and sex; (2) Census counts are not necessarily complete, and the degree of completeness may vary from group-to-group; (3) Military personnel are assigned by the Census to the post at which they are located, not their original home; (4) College students (if they reside on campus) are assigned to the college community; (5) Resident listings on birth and death certificates are not necessarily completely accurate; and (6) An undetermined number of persons listed as white in 1970 were enumerated as nonwhite in the 1980 Census.

Population figures for 1970 and 1980 are from the U.S. Census Bureau.

Similar reports have been prepared for Northern and Central Indiana. Copies of this report and information on the others may be obtained from:

APPENDIX.. 191

SOUTHERN INDIANA

Net Migration Patterns

Southern Indiana was the only section of the State which had net migration gains between 1970 and 1980, with the 60,000 plus figure split rather evenly between males and females. Whites and nonwhites each had net migration gains.

Heaviest migration gains were in the groups between 15 and 25 in 1980. Only those 25 to 29 and females 30-34 suffered significant migration losses.

Net migration accounted for almost half of Southern Indiana's intercensal gain of 10.3 percent between 1970 and 1980. Without migration, the gain would have been approximately 5.4 percent.

Other pertinent data on migration for the region and its subareas are given in Tables 1, 2, 3, and B.

Population by Race and Sex

Over the decade, Southern Indiana's nonwhite population increased from 2.4 to 3.1 percent of the total. For the same period, the male proportion remained unchanged at 48.6 percent.

The white population had a considerably higher median age than the nonwhite, and the median age of males was well below that of women.

Additional information on population by race and sex appears in Tables 1, 2, 3, A, B, and F.

Population by Age

Reflecting the baby boom of the fifties and sixties, one third of Southern Indiana's 1980 population was between 10 and 30. Nearly half was over 30; and in general, the population tended to be older than was the case in 1970.

Age groups under 15 and between 40 and 50 experienced population loss between 1970 and 1980, with the heaviest ga[illegible] occurring among those between 20 and 40 and over 85.

The dependency ratio dropped sharply from .81 to .67 over the 10 years, with all the decline accounted for by those under 18.

More figures on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA III-1 (TERRE HAUTE)

Net Migration Patterns

Between 1970 and 1980, Subarea III-1 gained some 400 persons net through in-migration. The gain was relatively equal by sex, but nonwhites showed increases, while whites had slight net loss.

Most age groups showed net migration gains, but those between 25 and 35 in 1980 were a marked exception to the rule, with heavy net out-movement over the 10-year period. Those between 35 and 40 and over 80 in 1980 showed modest losses.

While net migration was positive, it was a negligible factor in the Area's growth. The total growth rate was 2.51 percent, with only .18 percent attributed to migration.

Other data on migration for the Subarea and its counties may be found in Tables 1, 2, 3, and B.

Population by Race and Sex

Over the 10-year period, the nonwhite population in the Area increased from 3.1 to 3.8 percent of the total. At the same time, there was little change in the male proportion, which went from 48.5 to 48.4 percent.

The female population had a much higher median age than the male, and the white a higher "average" age than the nonwhite.

More data on race and sex are given in Tables 1, 2, 3, A, B, and F.

Population by Age

More than 35 percent of the Subarea population in 1980 was between 10 and 30.

Population between 5 and 15 and between 45 and 50 was down markedly in 1980 over 10 years before. Groups with smaller declines were 0-4, 15-19, 40-44, and 50-54, with all other ages showing a greater population in 1980 than 1970.

Over the decade, the dependency ratio dropped from .78 to .67, with almost all of the decline accounted for by the smaller number of persons under 18 in 1980.

Additional figures on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA III-2 (BLOOMINGTON)

Net Migration Patterns

In the decade between 1970 and 1980, Subarea III-2 gained over 15,000 people net through in-migration. The gain was almost equally split between males and females, and both whites and nonwhites showed sizable migration increases.

Only those between 25 and 40 in 1980 experienced sizable losses through migration in the 10 years, with the 5-9 and 40-44 groups showing slight net out-migration. Heaviest net gain through migration occurred in the group that was between 20 and 25 in 1980, though the 15-19 group also had large gains.

The Area showed a 15.8 percent gain between 1970 and 1980, with 9.6 percent coming through migration (over 60 percent of the total gain).

Other information on migration is given in Tables 1, 2, 3, and B.

Population by Race and Sex

Over the intercensal period, the nonwhite population in the Bloomington Area increased from 1.6 to 3.1 percent of the total. For the same period, the female population went from 51.1 to 51.3 percent.

Following the State and Regional pattern, the Subarea females had a higher median age than males, and the "average" age of whites was well above that of nonwhites.

Additional material on race and sex appears in Tables 1, 2, 3, A, B, and F.

Population by Age

Because of the post-War baby boom and the presence of a large university, over 40 percent of the 1980 population was between 10 and 30.

For the Subarea, there was a smaller population in each group under 15 in 1980 than 10 years before, but all other groups showed increases. Largest gains were in the 25 to 40 ages and among those over 80.

The dependency ratio dropped from .66 to .54 over the decade, with all the decrease coming from those under 18.

More figures on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA III-3 (COLUMBUS)

Net Migration Patterns

In the 10 years between 1970 and 1980, Subarea III-3 gained over 15,000 persons net through in-migration. There was slightly more gain among the male population, but all race-sex groups experienced some increase.

Only the group that was 20-24 in 1980 showed net loss through migration, with the biggest gainers between 5 and 15 and in the early thirties.

Migration accounted for nearly half of the Area's 14.1 percent increase for the decade, accounting for a 6.6 percent gain.

Other information on migration for the Subarea and its counties is given in Tables 1, 2, 3, and B.

Population by Race and Sex

In the intercensal period, the Columbus Area increased its nonwhite population from 0.8 to 1.4 percent of the total. For the same period, the male population went from 48.8 to 48.9 percent.

The median age of the female population was greater than that of the male, and the white population averaged considerably older than the nonwhite.

More figures on race and sex may be found in Tables 1, 2, 3, A, B, and F.

Population by Age

Over a third of the 1980 Area population was between 10 and 30, with the 15-19 group the largest.

Only the age groups under 15 had smaller populations in 1980 than 1970, while those between 20 and 40 and over 85 showed major increases.

Additional data on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA III-4 (VINCENNES)

Net Migration Patterns

In the decade between 1970 and 1980, the Vincennes Subarea gained some 3,500 persons net through migration. More than two thirds of this gain was among males. The Area had a small nonwhite group, but it contributed to the net in-migration.

The age groups between 20 and 30 in 1980 suffered heavy migration losses, but all other ages showed gains or no loss. The increase was relatively evenly split over ages, with those groups under 20, 30-34, and 65-69 in 1980 each gaining over 500 persons net through migration.

Of the Area's 5.73 percent growth in the intercensal period, 2.26 percent or almost 40 percent was contributed by net in-movement.

Other data on migration for the Vincennes Area and its counties are given in Tables 1, 2, 3, and B.

Population by Age

Over one third of the Subarea 1980 population was between 10 and 30, a reflection of the post-War baby boom.

The population under 15 and between 40 and 55 was smaller in 1980 than 10 years previous. All other age groups had a larger population than in 1970. Greatest gain occurred in those groups between 20 and 35 and over 85.

Additional figures on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA III-5 (JEFFERSONVILLE, NEW ALBANY)

Net Migration Patterns

This Subarea gained some 19,000 persons net through in-migration between 1970 and 1980. There was an even distribution between males and females, and each race-sex group showed net in-migration.

Only the group that was between 20 and 25 in 1980 lost population through migration over the 10-year period. Heaviest gainers were those age groups between 5 and 15 and 30-34 in 1980.

Migration accounted for 8.82 percent growth in the decade, over half of the Subarea's total rate of increase.

Other information on migration for the Jeffersonville-New Albany Area may be found in Tables 1, 2, 3, and B.

Population by Race and Sex

In the intercensal period, the nonwhite proportion of the population increased from 2.8 to 3.5 percent of the total. There was no change in the proportion by sex, with the female share of 51.3 remaining constant.

As was typical for the State and the Region, Subarea III-5's female population had a higher median age than the male, and the white averaged older than the nonwhite.

Additional material on population by race and sex is given in Tables 1, 2, 3, A, B, and F.

Population by Age

Approximately 35 percent of the 1980 Area population was in the 10 to 30 age range, with the largest share (9.4 percent) in the 15-19 group.

Only the 5-14 and the 45-49 groups had smaller populations in 1980 than 1970. Greatest increases occurred in the groups between 20 and 40 and over 85. There were 62 percent more people between 30 and 35 in 1980 than in 1970.

Further data on population by age are shown in Tables 1, 2, 3, C, D, E, F, and G.

SUBAREA III-6 (EVANSVILLE)

Net Migration Patterns

Between 1970 and 1980, the Evansville Subarea experienced a net gain of some 7,000 persons through migration. The sex distribution was almost equal, and nonwhites shared in the gain.

By age, only those between 20 and 30 in 1980 showed losses through migration, with the 10-14 and 30-34 groups showing the largest net gains.

Migration contributed 2.80 percent of the 7.62 percent growth rate for the decade, thus accounting for well over one third of the population increase.

Further data concerning migration may be found in Tables 1, 2, 3, and B.

Population by Race and Sex

In the intercensal period, the Evansville Subarea increased its nonwhite proportion from 4.5 to 5.2 percent of the total. The male share remained at 48.1 percent over that period.

The median age of the female population was well above the male, and the white population was considerably older than the nonwhite.

More information on population by race and sex appears in Tables 1, 2, 3, A, B, and F.

Population by Age

The 20-24 age group was the largest in 1980, accounting for 9.3 percent of the Area population. Over one third of the total fell between 10 and 30.

There was a smaller population between 5 and 15 and between 40 and 50 in 1980 than a decade earlier. Increases of over 40 percent each occurred in those groups between 20 and 35 and over 85.

Additional figures on population by age are given in Tables 1, 2, 3, C, D, E, F, and G.
